**Measurement Uncertainty**

| Parameter                     | Uncertainty                |
|-------------------------------|----------------------------|
| Radio Frequency               | $\pm 1 \times 10^{-5}$ MHz |
| Radiated Emissions            | $\pm 3$ dB                 |
| Temperature                   | $\pm 1^\circ\text{C}$      |
| Humidity                      | $\pm 5$ %                  |
| DC and low frequency voltages | $\pm 3$ %                  |

## **Andersen Corporation Operational Description:**

### 1. Overview

The device is a security sensor for Doors. It has a Reed Switch sensors for OPEN/CLOSE, and a levered switch for LOCKED/UNLOCKED. When the door is OPEN/CLOSED or LOCKED/UNLOCKED, the reed switch or levered switch is activated, which triggers a change of state on the sensor's microprocessor. The microprocessor then powers up the RF transmitter (Pulse Width Modulated OOK) and sends two sets of six identical packets (sextets) that flag the change of state to a receiver. The 12 packets (total) are sent with a random delay between them of 100 mS to 130 mS. The two sextets have a random delay between them of 0.580Sec to 1.430Sec.

When there is no change of state occurring, the device goes into a very low-power mode, and wakes up twice a second to check and see if there is a change of state on the reed switch. This is done using a timer internal to the microprocessor. The sensor times out every 72 minutes and transmits a Supervisory message to allow the receiver to know it is still operational. Further, a battery level indicator (ok, or low) is sent with every message packet allowing a service technician to change the battery when it gets low.

### 2. Battery Section

The unit uses two lithium coin cell batteries CR1632 size, and are replaceable in the package. The device operates in three modes, Idle, Monitor, and Transmit. The majority of the time the device is in the "Idle" state, and this is the major contributor to battery life, which is expected to be greater than 5 years typical.

### 3. Microprocessor Section

The microprocessor is a TI MSP430G2231 (U1) with onboard Flash and RAM.

Twice per second the microprocessor samples the state of the reed switch. When a change of state is detected, or a "heartbeat timeout" occurs, the microprocessor powers on the RF transmitter by raising the EN line high (U1-12), and after a brief power-up time, data is sent out on U1-11, in an amplitude shift keyed format, using On-Off keying.

### 4. RF Transmitter

The RF transmitter (U1) is a single frequency OOK transmitter (Melexis part TH72005). It uses a fixed Phase Locked Loop on chip to generate the transmit frequency from a crystal reference (Y1= 10.77938MHz). C4 is used with the crystal Y1 to set the fixed transmit frequency of 344.94MHz.

L1 is used to provide an RF choke to the amplifier power supply. The transmit output is matched to 50 ohms through CM1, CM2, CM3 and LM1. There is a further amplifier Q1 (NE678M04) that follows and drive a printed Loop Antenna on the pcb to complete the transmit chain.

### 5. Modulation Type is Amplitude Shift Keyed – On/Off keyed (ASK-OOK)

6. The carrier is modulated directly by the data coming from the microprocessor. It is a Phase Encoded (Manchester) baseband signal.
7. Peak frequency deviation is not applicable to ASK
8. The transmission rate is 3.7 Kbits/sec.

9. The rated output power into the antenna is 13dBm or 20milliwatts.

## **PULSED OPERATION**

### **Duty Cycle Correction factor**

On a change of state, 6 identical packets are transmitted at random intervals. The time interval between each packet is no less than 100mS and averages 125 mS. Each packet is 64 bits (16 bits preamble, 48 bit data) transmitted as PWM-ASK modulation.

Bits are Phase Encoded (Manchester) at baseband, so the duty cycle is exactly 50%. Each bit cell interval is 0.27mS, so the total on time per packet is:

$$\text{On Time} = 64 \text{ bits} * 0.5 \text{ on/bit} * 0.27\text{mSec} = 8.64 \text{ mSec}$$

Thus, for every 100 ms, we are transmitting for 8.64 ms of that time period. Therefore our duty cycle correction factor (in the worst case 100mSec period) is:

$$\text{DUTY CYCLE CORRECTION FACTOR (dB)} = 20 * \text{Log}(0.0864) = -21.3 \text{ dB}$$

### **Transmission Time Duration from Trigger Point to End of Transmission**

The processor samples the reed switch approximately once per second. After detecting a change of state, it constructs the packet (1mS), then enables the VCO on the transmitter to power up (10mS), but does not transmit during that time. Then 4 packets (29 mS each) are sent, with a random timeout between them (100mS – 800mS). Therefore the total duration time from when the device is triggered, to when transmission is completed and turned off (worst case) is 3.527 seconds.

0.000s Trigger Point

2.000s Microprocessor sample time (on close of reed switch worst case)

0.002s Microprocessor setup time for packet construction and transmitter warmup (worst case) 0.645s Sextet Packet Transmission (1<sup>st</sup> group of 6 packets)

1.305s worst case delay between sextet#1 and sextet #2

0.770s Sextet Packet Transmission (2<sup>nd</sup> group of 6 packets)

4.722s Total worst case duration from when device is triggered to transmission completed/off.

Timing plots are given below.

Figure 1 Transmitted (1<sup>st</sup> Sextet) Data Packets, 100ms/div

Figure 2 Transmitted Data Packet, 2.0 ms/div

Figure 3 Transmitted Data Packet, 0.5 ms/div

## **Section II: Report of Measurement Test Procedures**

### **Radiated Interference:**

The measurement was made per ANSI C63.4-2003 using an Agilent model 8566B spectrum analyzer, a model 85685A Preselector, a model 85650A quasi-peak adapter, and the appropriate antenna. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The resolution bandwidth was adjusted accordingly with an appropriate sweep time and the video bandwidth was adjusted accordingly up to the 10<sup>th</sup> harmonic of the fundamental. When an emission was found, the table was rotated and the mast raised and lowered between 1 and 4 meters to produce the maximum signal strength. An average measurement was taken. The antenna was placed in both the horizontal and vertical planes and the stronger of the two emissions were reported. The spectrum was searched to the tenth harmonic of the transmitter.

### **Formula of Conversion Factors:**

The field strength at 3m was established by adding the antenna factor and cable losses to the meter reading of the spectrum analyzer. The antenna correction factors are stated in terms of dB. The gain of the Preselector was accounted for in the spectrum analyzer meter reading, but any external amplifier gain and distance correction also had to be accounted for.\*

$$\begin{array}{rcllclclcl} \text{Eg.:} & \text{Freq (MHz)} & \text{Meter Reading} & + & \text{ACF} & + & \text{Cable Loss} & - & \text{Amp Gain} & - & \text{Distance Factor} & = & \text{Field Strength} \\ & 330 & 52.5 \text{ dB}\mu\text{V @ 1m} & & +5.0 \text{ dB} & & +0.5 \text{ dB} & & -18.5 \text{ dB} & & - 9.5 \text{ dB} & = & 50 \text{ dB}\mu\text{V/m @ 3m} \end{array}$$

\* Where the field strength was too low to get an accurate reading at the required distance of 3 meters, the Antenna was moved closer to 1 meter. The resulting measurement was distance corrected for 3 meters by using the formula: (closer distance result) – (20Log(measured distance/required distance)) = (required distance result)

$$\begin{array}{rcllclcl} \text{Eg.:} & 1\text{M reading (dB}\mu\text{V/m)} & - & (20\text{Log}[1/3]) \text{ dB} & = & 3\text{M reading (dB}\mu\text{V/m)} \\ & 55.42 \text{ dB}\mu\text{V @ 1m} & & - 9.54 \text{ dB} & = & 45.88 \text{ dB}\mu\text{V @ 1m} \end{array}$$

### **Power Line Conducted Interference:**

No measurements were taken as the EUT is powered by a battery.

### **Occupied Bandwidth:**

A sample of the transmitter output detected by an antenna was fed into the spectrum analyzer and the attached plot was printed. The vertical scale is set to 10dB per division. The Resolution Bandwidth (RBW) was set to as close to 1% of the span as possible. The Video Bandwidth was set to three times the RBW.

### **ANSI C63.4-2003 Measurement Procedures:**

The EUT was placed in a vertical orientation, on top of a table 80 cm high with a radius of 48cm. The EUT was placed in the center of the table. The table used for radiated measurements is capable of continuous rotation. When an emission was found, the antenna was raised and lowered between 1 and 4 meters, the table was then rotated to produce the maximum signal strength and then the antenna was raised and lowered from 1 to 4 meters again to produce the maximum emission level. The antenna was placed in both the horizontal and vertical planes.

All frequencies were first found using a peak detector and then measured using video averaging to average the signal.

## Section III: Report of Measurement of Radiated Emissions

**DATE:** December 19<sup>th</sup>, 2011

**TEST STANDARD:** FCC CFR Title 47, Part 15, Subpart B 15.231(b)

**TEST VOLTAGE:** 3 V DC, as noted in the individual test records

**REQUIREMENTS:**

FCC Pt 15.231

| Fundamental Frequency (MHz) | Field Strength of Fundamental (μV/m) @ 3m | Field Strength of Spurious Emissions (μV/m) @ 3m |
|-----------------------------|---|--|
| 40.66 - 40.70               | 2250                                      | 225  |
| 70 - 130                    | 1250                                      | 125  |
| 130 - 174                   | 1250 to 3750*                             | 125 to 375*                                      |
| 174 - 260                   | 3750                                      | 375  |
| 260 - 470                   | 3750 to 12500*                            | 375 to 1250*                                     |
| Above 470                   | 12500                                     | 1250   |

Note: Limits in the above table are based on the average value of the measured emissions.

\* Linear interpolation

### CALCULATING LIMIT LINE FOR THE FUNDAMENTAL FREQUENCY

$$\begin{aligned}
 \text{FS (microvolts/m)} &= (41.67 \times F) - 7083 \\
 &= (41.67 \times 344.92) - 7083 \\
 &= 7289.82 \mu\text{V/m}
 \end{aligned}$$

$$\begin{aligned}
 [\text{dB}\mu\text{V/m}] &= 20 \times \log(7289.82) \\
 &= 77.25 \text{ dB}\mu\text{V/m @ 3m}
 \end{aligned}$$

$$\begin{aligned}
 [\text{@ 1m}] &= 77.25 + 9.54 \\
 &= 86.79 \text{ dB}\mu\text{V/m @ 1m}
 \end{aligned}$$

Note: The limit line for all unwanted and spurious emissions is 20 dB lower as per RSS-210 and Section 15.231 of the FCC mandate.

**MEASUREMENT DATA:** See Appendix A for spurious emission readings within 20dB of the limit.

**PERFORMANCE: PASS.** The radiated emissions for the EUT meet the requirements for FCC CFR Title 47 Part 15.231. The spectrum was checked to the tenth harmonic. Spurious emissions were looked for between 30 MHz and 3500 MHz. Tables and plots can be found in Appendix A.

**NOTES:** The plots in appendix A have two traces. The red trace is when the EUT is on, and the black trace is an ambient trace. The letter "A" above any emission on the plots means that emission is an ambient. The frequency, uncorrected peak value, turntable degree location, mast height and delta from the Class B limit line is given above emissions coming from the EUT. The Class B limit lines are not the applicable limit lines for this device. No emissions came above the applicable limit line as given in Part 15.231.

**RF EXPOSURE EVALUATION:** As per RSS-102 Issue 4 a RF Exposure Evaluation has to be taken.

The RF Field Strength Limit for Devices Used by the General Public (Uncontrolled Environment) at 344.92 MHz for the electric field is given by the following formula:  $1.585(f)^{0.5}$

Therefore the limit is set at: 29.43 V/m.

The measured average value of the electric field was measured at: 70.9 dBuV/m = 0.0035 V/m.

Therefore the EUT passes the requirements of the RF Exposure Evaluation.

## Section IV: 20dB Bandwidth Testing

Rules Part No.: FCC CFR Title 47 Part 15 Subpart B 15.231(c)

### Requirement

As per the above standard, The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. The bandwidth is determined at the points 20 dB down from the modulated carrier.

20dB bandwidth limit = Fundamental \* 0.25%

$$= 344.92 \text{ MHz} * 0.25\%$$

$$= 862.3 \text{ kHz}$$

**Performance: PASS.** As per below, 20 db bandwidth is less than 0.25% of the center frequency (862.3 kHz) for the EUT.

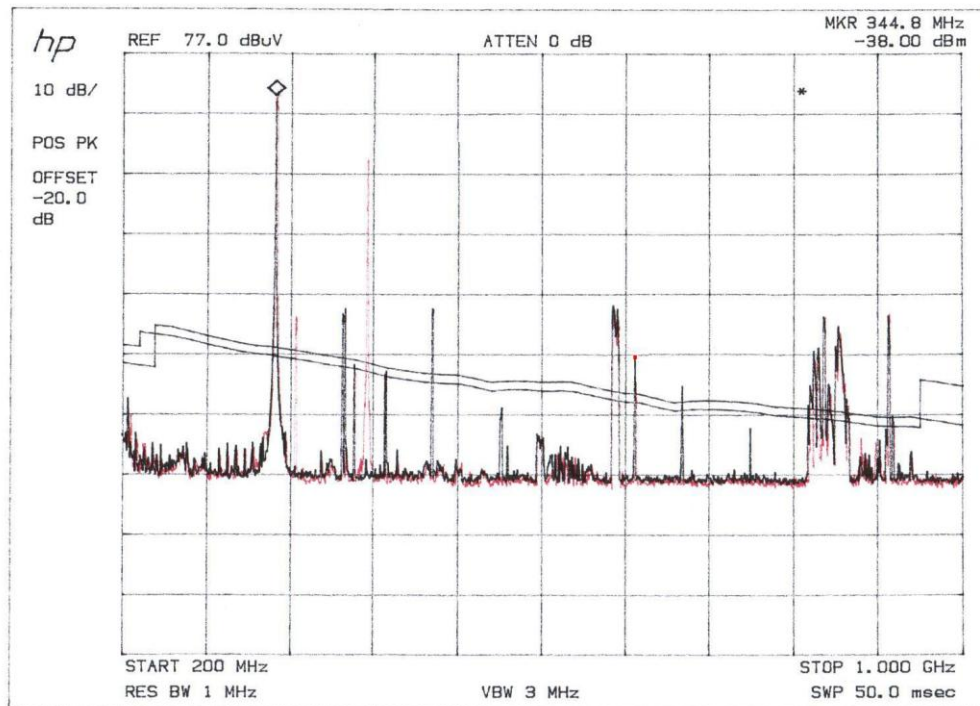

**20dB Bandwidth Test: Door Sensor**

## Appendix A: Fundamental, Harmonics and Spurious Emissions Data and Plots

**MEASURED VALUES:** All measurable readings between 0.009 MHz and 3500 MHz.

| Frequency (MHz) | Measured Value (dBm) | (dBuV) | Total Correction | Field Strength (dBuV/m) | Duty Cycle Averaging (dBuV/m) | Limit (dBuV/m) | Margin (dB) |
|-----------------|----------------------|--------|------------------|-------------------------|-------------------------------|----------------|-------------|
| 344.94          | -38.1                | 68.9   | 19.1             | 88                      | 21.3                          | 77.25          | -10.55      |
